#### Abstract

In this paper we establish necessary and sufficient condition for zero duality gap of the optimization problem involving the general perturbation mapping via characteringsetunder the convex setting. An application to the class of composite optimization problems will also be given to show that our general results can be applied to various classes of optimization problems.

Keywords: Characterizing set, composite optimization problem, perturbation function, zero duality gap.

## 1. Introduction

It is well known that duality theory plays an important role in optimization. For a primal problem, there are different ways to define its dual problems (Feizollahi et al., 2017, Huang \& Yang, 2003, Li, 1995, Yang \& Huang, 2001). The zero duality gap is known as the state in which the optimal values of the primal problem and that of its dual problem are equal. Many attempts have been made to study the zero duality gap for various classes of optimization problems in recent decades (Feizollahi et al., 2017, Huang \& Yang, 2003, Jeyakumar \& Li, 2009a, Jeyakumar \& Li, 2009b, Jeyakumar \& Wolkowicz, 1990, Li, 1995, Huang \& Yang, 2003, Yang \& Huang, 2001, Li, 1999, Long \& Zeng, 2020, Rubinov et al., 2002). In this paper, we establish characterizations of zero duality gap property for the general optimization problem which can then be applied to many different specific classes optimization problems.

We are concerned with the so-called perturbation function $\phi: X \times Y \rightarrow \mathbb{R} \cup\{+\infty\}$ and the optimization problem

$$
\text { (P) } \quad \inf _{x \in X} \phi\left(x, 0_{Y}\right) \text {, }
$$

Where $X, Y$ are locally convex Hausdorff topological vector spaces, $Y_{+}$is non-empty convex cone in $Y$. We assume in this paper that $\operatorname{dom} \phi\left(., 0_{Y}\right) \neq \varnothing$, or in other words, the problem (P) is feasible, meaning that $v(\mathrm{P})<+\infty$. It is worth commenting that many classes of optimization problems can be written in the form of (P) (see Boţ, 2010). So, investigating the problem $(\mathrm{P})$ gives us a unified approach to all optimization problems.

In this paper, we study characterizations of the zero duality gap property for the problem ( P ) via its characterizing set which is inspired by the concept of characterizing set introduced by Dinh et al. (2020) for the vector optimization with geometric and cone constrains. It is worth observing that the characterizing set is rather simpler than those sets in the form of epigraph of conjugate mapping. Therefore, the conditions imposed on the characterizing set will be easier to handle than the ones related to the epigraph of conjugate mapping proposed recently to examine
the zero duality gap property (see, e.g., Jeyakumar \& Li, 2009a).

The paper is organized as follows: In Section 2 we recall some notation and introduce some preliminary results which will be used in the sequel. Characterizing set and Lagrange dual problems of the problem ( P ) are introduced in Section 3 with related basic properties. Section 4 is devoted to establish the main results of this paper, that is, the characterization of zero duality gap for the problem ( P ) under the convex setting. As an illustrative example, in Section 5, we show how to apply generalized results to the classes of composite optimization problems.

## 2. Preliminaries

Throughout the paper, we consider $X$ and $Y$ the locally convex Hausdorff topological vector spaces with topological dual spaces $X^{*}$ and $Y^{*}$, respectively. $Y_{+}$is a non-empty convex cones in $Y$ while $Y_{+}^{*}$ aims the set of positive functionals on $Y$ with respect to $Y_{+}$, i.e.,

$$
Y_{+}^{*}:=\left\{y^{*} \in Y^{*}:\left\langle y^{*}, k\right\rangle \geq 0 \quad \text { for all } k \in Y_{+}\right\} .
$$

$$
\text { Let } \quad f: X \rightarrow \overline{\mathbb{R}}:=\mathbb{R} \cup\{-\infty,+\infty) \text {.Domain, }
$$ epigraph, and hypograph of $f$ are defined by, respectively,

$$
\begin{aligned}
\operatorname{dom} f & :=\{x \in X: f(x) \neq+\infty\}, \\
\text { epi } f & :=\{(x, \alpha) \in X \times \mathbb{R}: f(x) \leq \alpha\}, \\
\text { hyp } f & :=\{(x, \alpha) \in X \times \mathbb{R}: f(x) \geq \alpha\} .
\end{aligned}
$$

$f$ is said to be proper if $f(x) \neq-\infty$ for all $x \in X$ and $\operatorname{dom} f \neq \varnothing$. We say that $f$ is convex if the following condition holds for all $x_{1}, x_{2} \in X$ and $\alpha \in(0,1)$

$$
f\left(\alpha x_{1}+(1-\alpha) x_{2}\right) \leq \alpha f\left(x_{1}\right)+(1-\alpha) f\left(x_{2}\right) .
$$

It is easy to see that $f$ is convex if and only if epi $f$ is a convex subset of $X \times \mathbb{R}$. The conjugate function of $f$ is defined as $f^{*}: X^{*} \rightarrow \overline{\mathbb{R}}$ such that

$$
f^{*}\left(x^{*}\right)=\sup _{x \in X}\left[\left\langle x^{*}, x\right\rangle-f(x)\right] .
$$

We consider in $Y$ the partial order induced by $Y_{+}, \leqq_{Y_{+}}$, defined as

$$
y_{1} \leqq_{Y_{+}} y_{2} \quad \text { if and only if } \quad y_{2}-y_{1} \in Y_{+} .
$$

We also enlarge $Y$ by attaching a greatest element $+\infty_{Y}$ and a smallest element $-\infty_{Y}$, which do not belong to $Y$, and define $Y^{\bullet}:=Y \cup\left\{-\infty_{Y},+\infty_{Y}\right\}$. Let $H: X \rightarrow Y^{*}$. We say that $H$ is a $Y_{+}$-convex mapping if, for all $x_{1}, x_{2} \in X$ and $\alpha \in(0,1)$,

$$
H\left(\alpha x_{1}+(1-\alpha) x_{2}\right) \leqq_{Y} \alpha H\left(x_{1}\right)+(1-\alpha) H\left(x_{2}\right) . \mathrm{We}
$$ define the domain of $H$ as $\operatorname{dom} H:=\left\{x \in X: H(x) \neq+\infty_{Y}\right\}$ and say that $H$ is proper if $-_{Y} \notin H(X)$ and $\operatorname{dom} H \neq \varnothing$. When $H$ is a proper mapping, the image and the graph of $H$ are defined by, respectively,

$$
\begin{aligned}
\operatorname{im} H & :=\{H(x): x \in \operatorname{dom} H\}, \\
\operatorname{gr} H & :=\{(x, H(x)): x \in \operatorname{dom} H\} .
\end{aligned}
$$

We say that $g: Y \rightarrow \overline{\mathbb{R}}$ is a $Y_{+}$-nondecreasing function if $g\left(y_{1}\right) \leq g\left(y_{2}\right)$ whenever $y_{1} \leq_{Y} y_{2}$. In the meantime, for $y^{*} \in Y^{*}$, we convention that

$$
\left(y^{*} \circ H\right)(x)=\left\{\begin{array}{cc}
\left\langle y^{*}, H(x)\right\rangle & \text { if } \\
+\infty & \text { else } .
\end{array}\right.
$$

## 3. Characterizing set and Lagrange dual problems

### 3.1. Characterizing set

Corresponding to the problem (P), we consider the characterizing set

$$
\begin{equation*}
\mathfrak{C}:=\bigcup_{x \in X} \operatorname{epi} \phi(x, .) \subset Y \times \mathbb{R} . \tag{3.1}
\end{equation*}
$$

Proposition 3.1. Under the current assumption $\operatorname{dom} \phi\left(., 0_{Y}\right) \neq \varnothing$, one has $\left(0_{Y}, r\right) \in \mathfrak{C}$ for some $r \in \mathbb{R}$. In particular, $\mathfrak{C} \neq \varnothing$.

Proof. As $\operatorname{dom} \phi\left(., 0_{Y}\right) \neq \varnothing$, there exists $\bar{x} \in X \quad$ such that $\quad \phi\left(\bar{x}, 0_{Y}\right) \in \mathbb{R}$. Take $\bar{r}:=\phi\left(\bar{x}, 0_{Y}\right) \in \mathbb{R}$, one has $\left(0_{Y}, \bar{r}\right) \in \operatorname{epi} \phi(\bar{x},.) \subset \mathfrak{C}$, and we are done.

The convexity of $\mathfrak{C}$ is shown in the following proposition.

Proposition 3.2. If $\phi$ is convex then $\mathfrak{C}$ is a convex subset of $Y \times \mathbb{R}$.

Proof. We begin by proving that $\mathfrak{C}$ is image of the set epi $\phi$ by the conical projection $\pi_{Y \times \mathbb{R}}: X \times Y \times \mathbb{R} \rightarrow Y \times \mathbb{R}, \pi_{Y \times \mathbb{R}}(x, y, r)=(y, r) \quad$ for all $(x, y, r) \in X \times Y \times \mathbb{R}$. Indeed, for all $(y, r) \in Y \times \mathbb{R}$,

$$
\begin{aligned}
(y, r) \in \mathfrak{C} & \Leftrightarrow \exists x \in X:(y, r) \in \operatorname{epi} \phi(x, .) \\
& \Leftrightarrow \exists x \in X: r \geq \phi(x, y) \\
& \Leftrightarrow \exists x \in X:(x, y, r) \in \phi \\
& \Leftrightarrow(y, r) \in \pi_{Y \times \mathbb{R}} \text { epi } \phi .
\end{aligned}
$$

So, if $\phi$ is a convex function then epi $\phi$ is a convex subset of $X \times Y \times \mathbb{R}$ which yields that $\mathfrak{C}=\pi_{Y \times \mathbb{R}} \operatorname{epi} \phi$ is convex, as well.

The next proposition gives a presentation of the value of the problem (P) via its characterizing set $\mathfrak{C}$.

## Proposition 3.3. It holds

$$
v(\mathrm{P})=\inf \overline{\left\{r \in \mathbb{R}:\left(0_{Y}, r\right) \in \mathfrak{C}\right\}} .
$$

Proof. Let us denote $\mathcal{C}:=\overline{\left\{r \in \mathbb{R}:\left(0_{Y}, r\right) \in \mathfrak{C}\right\}}$. We will prove that $v(\mathrm{P})=\inf \mathcal{C}$.

Firstly, recall that

$$
\begin{equation*}
v(\mathrm{P})=\inf _{x \in X} \phi\left(x, 0_{Y}\right) \tag{3.2}
\end{equation*}
$$

Take arbitrarily $r \in \mathcal{C}$. Then, there exists a net $\left(r_{i}\right)_{i \in I}$ such that $\left(0_{Y}, r_{i}\right)_{i \in I} \subset \mathfrak{C}$ and $r_{i} \rightarrow r$. For each $i \in I$, as $\left(0_{Y}, r_{i}\right) \in \mathfrak{C}$, there is $x_{i} \in X$ such that $\phi\left(x_{i}, 0_{Y}\right) \leq r_{i}$. By (3.2), $\phi\left(x_{i}, 0_{Y}\right) \geq v(\mathrm{P})$, and hence, $v(\mathrm{P}) \leq r_{i}$ for all $i \in I$. Letting $r_{i} \rightarrow r$, we get $v(\mathrm{P}) \leq r$.

Take $\eta>v(\mathrm{P})$. It follows from (3.2) that there is $x_{\eta} \in X$ satisfying $\eta>\phi\left(x_{\eta}, 0_{Y}\right):=r_{\eta}$. Note that

$$
\left(0_{Y}, r_{\eta}\right) \in \operatorname{epi} \phi\left(x_{\eta}, .\right) \subset \mathfrak{C}
$$

which leads to $r_{\eta} \in\left\{r \in \mathbb{R}:\left(0_{Y}, r\right) \in \mathfrak{C}\right\} \subset \mathcal{C}$. Briefly, we have just shown that, for all $\eta>v(\mathrm{P})$, there exists $r_{\eta} \in \mathcal{C}$ such that that $\eta>r_{\eta}$.

So, $v(\mathrm{P})=\inf \mathcal{C}$ and we are done.

### 3.2. Lagrange dual problems

The Lagrange dual problem and the loose Lagrange dual problem of (P) are defined as follows, respectively,
(D)

$$
\begin{array}{ll}
\text { (D) } & \sup _{y^{*} \in Y^{*}(x, y) \in X \times Y} \inf \left[\phi(x, y)+\left\langle y^{*}, y\right\rangle\right], \\
\left(\mathrm{D}_{+}\right) & \sup _{y^{*} \in Y_{+}^{* *}(x, y) \in X \times Y} \inf \left[\phi(x, y)+\left\langle y^{*}, y\right\rangle\right] .
\end{array}
$$

It is worth noting that $y^{*}$ in the dual problem (D) can be considered as the Lagrange multiplier while the one in ( $\mathrm{D}_{+}$) also can be understood as a positive Lagrange multiplier.

Proposition 3.4 (Weak duality).

$$
v\left(\mathrm{D}_{+}\right) \leq v(\mathrm{D}) \leq v(\mathrm{P})<+\infty .
$$

Proof. The first inequality follows immediately from the property of supremum. For the second inequality, taking arbitrarily $\bar{x} \in X$, we will prove that

$$
\begin{equation*}
\nu(\mathrm{D}) \leq \phi\left(\bar{x}, 0_{Y}\right) . \tag{3.3}
\end{equation*}
$$

Indeed, for all $y^{*} \in Y^{*}$, one has

$$
\begin{aligned}
D_{y^{*}} & :=\inf _{(x, y) \in X \times Y}\left\{\phi(x, y)+\left\langle y^{*}, y\right\rangle\right\} \\
& \leq \phi\left(\bar{x}, 0_{Y}\right)+\left\langle y^{*}, 0_{Y}\right\rangle=\phi\left(\bar{x}, 0_{Y}\right) .
\end{aligned}
$$

Hence,

$$
v(\mathrm{D})=\sup _{y^{*} \in Y^{*}} D_{y^{*}} \leq \phi\left(\bar{x}, 0_{Y}\right) .
$$

We have just shown that (3.3) holds for any $\bar{x} \in X$. This leads to the fact that

$$
v(\mathrm{D}) \leq \inf _{\bar{x} \in X} \phi\left(\bar{x}, 0_{Y}\right)=v(\mathrm{P}) .
$$

The last one comes from the fact that ( P ) is feasible, and the proof is complete.

Theorem 3.1. Assume that $\phi$ is convex. Then, one has

$$
v(\mathrm{D})=\inf \left\{r \in \mathbb{R}:\left(0_{Y}, r\right) \in \overline{\mathfrak{C}}\right\} .
$$

Moreover, if $v(\mathrm{D}) \in \mathbb{R}$ then

$$
v(\mathrm{D})=\min \left\{r \in \mathbb{R}:\left(0_{Y}, r\right) \in \overline{\mathfrak{C}}\right\} .
$$

Proof. Denote

$$
\mathcal{M}:=\left\{r \in \mathbb{R}:\left(0_{Y}, r\right) \in \overline{\mathfrak{C}}\right\} .
$$

It follows from Proposition 3.1 that $\mathcal{M} \neq \varnothing$. Let us divide the proof into three steps.

- Step 1. Take arbitrarily $r \in \mathcal{M}$. We claim that $v(\mathrm{D}) \leq r$. As $r \in \mathcal{M}$, one has $\left(0_{Y}, r\right) \in \overline{\mathfrak{C}}$, and hence, there exists a net $\left(\left(y_{i}, r_{i}\right)\right)_{i \in I} \subset \mathfrak{C}$ such that $\left(y_{i}, r_{i}\right) \rightarrow\left(0_{Y}, r\right)$.

For each $i \in I$, as $\left(y_{i}, r_{i}\right) \in \mathfrak{C}$, there is $x_{i} \in X$ such that $\left(y_{i}, r_{i}\right) \in \operatorname{epi} \phi\left(x_{i},.\right)$, or equivalently,

$$
\begin{equation*}
r_{i} \geq \phi\left(x_{i}, y_{i}\right) . \tag{3.4}
\end{equation*}
$$

Next, taking arbitrarily $y^{*} \in Y^{*}$, one has

$$
\begin{align*}
D_{y^{*}} & =\inf _{(x, y) \in X \times Y}\left\{\phi(x, y)+\left\langle y^{*}, y\right\rangle\right\}  \tag{3.5}\\
& \leq \phi\left(x_{i}, y_{i}\right)+\left\langle y^{*}, y_{i}\right\rangle .
\end{align*}
$$

Combining (3.4) and (3.5) gives $D_{y^{*}} \leq r_{i}+\left\langle y^{*}, y_{i}\right\rangle$ for all $i \in I$. Proceeding to the limit, we obtain $D_{y^{*}} \leq r$ (recall that $\left.\left(y_{i}, r_{i}\right) \rightarrow\left(0_{r}, r\right)\right)$. So,

$$
v(\mathrm{D})=\sup _{y^{*} \in Y^{*}} D_{y^{*}} \leq r .
$$

- Step 2. Taking $\eta \in \mathbb{R}$ such that $\eta \geq v(\mathrm{D})$, we will show that $\eta \in \mathcal{M}$. On the contrary, suppose that $\eta \notin \mathcal{M}$. Then, it follows from this that $\left(0_{Y}, \eta\right) \notin \overline{\mathfrak{C}}$. As $\phi$ is a convex function, the set $\mathfrak{C}$ is convex (see Proposition 3.2), and hence, $\overline{\mathfrak{C}}$ is convex as well. So, according to the separation theorem (see Rudin, 1991, Theorem 3.4), there are $\bar{y}^{*} \in Y^{*}, \bar{\alpha} \in \mathbb{R}$ and $\bar{\lambda} \in \mathbb{R}$ such that

$$
\begin{equation*}
\bar{\lambda} \eta<\bar{\alpha}<\left\langle\bar{y}^{*}, y\right\rangle+\bar{\lambda} r, \quad \forall(y, r) \in \mathfrak{C} . \tag{3.6}
\end{equation*}
$$

We next prove that $\bar{\lambda}>0$. Fix $\bar{x} \in \operatorname{dom} \phi\left(., 0_{Y}\right)$ (it is possible as $\operatorname{dom}\left(., 0_{Y}\right) \neq \varnothing$ ). Then we have $\phi\left(\bar{x}, 0_{Y}\right) \in \mathbb{R}$. Set $\bar{r}=\max \left\{\eta, \phi\left(\bar{x}, 0_{Y}\right)\right\}$. Then, one has $\bar{r} \geq \phi\left(\bar{x}, 0_{Y}\right)$, hence, $\left(0_{Y}, \bar{r}\right) \in \operatorname{epi} \phi(\bar{x},.) \subset \mathfrak{C}$ which, together with (3.6), yields $\bar{\lambda} \eta<\bar{\lambda} \bar{r}$, or equivalently, $\quad \bar{\lambda}(\bar{r}-\eta)>0$. Combining this inequality with the fact that $\bar{r} \geq \eta$ (by the definition of $\bar{r}$ ) we obtain $\bar{\lambda}>0$. Consequently, it follows from this and (3.6) that

$$
\begin{equation*}
\eta<\tilde{\alpha}<\left\langle\tilde{y}^{*}, y\right\rangle+r, \quad \forall(y, r) \in \mathfrak{C}, \tag{3.7}
\end{equation*}
$$

where $\tilde{y}^{*}:=\frac{1}{\bar{\lambda}} \bar{y}^{*}$ and $\tilde{\alpha}:=\frac{1}{\bar{\lambda}} \bar{\alpha}$.
It is clear that for any $(x, y) \in \operatorname{dom} \phi$, one has

$$
(y, \phi(x, y)) \in \operatorname{epi} \phi(x, .) \subset \mathfrak{C},
$$

and hence, (3.7) entails

$$
\eta<\tilde{\alpha}<\left\langle\tilde{y}^{*}, y\right\rangle+\phi(x, y) .
$$

Thus,

$$
\begin{aligned}
\eta<\tilde{\alpha} & \leq \inf _{(x, y) \in \operatorname{dom} \phi}\left\{\phi(x, y)+\left\langle\tilde{y}^{*}, y\right\rangle\right\} \\
& =\inf _{(x, y) \in X \times Y}\left\{\phi(x, y)+\left\langle\tilde{y}^{*}, y\right\rangle\right\} .
\end{aligned}
$$

This implies that

$$
\eta<\sup _{y^{*} \in Y^{*}(x, y) \in X \times Y} \inf \left\{\phi(x, y)+\left\langle y^{*}, y\right\rangle\right\}=v(\mathrm{D})
$$

which contradicts the assumption $\eta \geq v(\mathrm{D})$. So, $\eta \in \mathcal{M}$ as desired.

- Step 3. Conclusion. We have just shown that:
(i) $v(\mathrm{D}) \leq r, \forall r \in \mathcal{M}$ (Step 1).
(ii) Take $\zeta>v(\mathrm{D})$. Then, there exists $\eta \in \mathbb{R}$ such that $\zeta>\eta \geq v(\mathrm{D})$ (recall that $v(\mathrm{D})<+\infty$, see Proposition 3.4). According to Step 2, one has $\eta \in \mathcal{M}$. Briefly, for all $\zeta>\nu(\mathrm{D})$, there is $\eta \in \mathcal{M}$ such that $\zeta>\eta$.

We thus get from (i) and (ii) that $\nu(\mathrm{D})=\inf \mathcal{M}$.

We now assume further that $v(\mathrm{D}) \in \mathbb{R}$. Then, it is obvious that $v(\mathrm{D}) \geq v(\mathrm{D})$. Replacing $\eta$ by $v(\mathrm{D})$ in Step 2, we get $v(\mathrm{D}) \in \mathcal{M}$. This, together with (i), yields that $v(\mathrm{D})=\min \mathcal{M}$.

Theorem 3.2. Assume that $\phi$ is convex and the following condition holds
$\left(C_{0}\right) \quad \phi(\hat{x},$.$) is bounded from above on Y_{+}$ for some $\hat{x} \in X$.
Then, $v\left(\mathrm{D}_{+}\right)=\inf \left\{r \in \mathbb{R}:\left(0_{Y}, r\right) \in \overline{\mathfrak{C}}\right\}$.
Moreover, if $v\left(\mathrm{D}_{+}\right) \in \mathbb{R}$, then $v\left(\mathrm{D}_{+}\right)=\min \left\{r \in \mathbb{R}:\left(0_{Y}, r\right) \in \overline{\mathfrak{C}}\right\}$.

Proof. Let us set

$$
\mathcal{M}:=\left\{r \in \mathbb{R}:\left(0_{Y}, r\right) \in \overline{\mathfrak{C}}\right\} .
$$

It is easy to see that $v\left(\mathrm{D}_{+}\right) \leq v(\mathrm{D})$. So, it follows from Theorem 3.1 that $v\left(\mathrm{D}_{+}\right) \leq \inf \mathcal{M}$.

Next, taking $\eta \in \mathbb{R}$ such that $\eta \geq v\left(\mathrm{D}_{+}\right)$, we will show that $\eta \in \mathcal{M}$. Suppose, contrary to our claim, that $\eta \notin \mathcal{M}$. By the same argument as in Step 2 of the proof of the previous theorem, there exist $\tilde{y}^{*} \in Y^{*}$ and $\tilde{\alpha} \in \mathbb{R}$ such that

$$
\begin{equation*}
\eta<\tilde{\alpha}<\left\langle\tilde{y}^{*}, y\right\rangle+r, \quad \forall(y, r) \in \mathfrak{C} . \tag{3.8}
\end{equation*}
$$

- We now prove that $\tilde{y}^{*} \in Y_{+}^{*}$. To do this, take arbitrarily $\bar{k} \in Y_{+}$. Then, we only need to show that $\left\langle\tilde{y}^{*}, \bar{k}\right\rangle \geq 0$. As $\left(C_{0}\right)$ holds, there are $\hat{x} \in X$ and $\hat{M}>0$ such that $\phi(\hat{x}, k) \leq \hat{M}$ for all $k \in Y_{+}$, which yields $\phi(\hat{x}, \mu \bar{k}) \leq \hat{M}$ for all $\mu>0$. Hence, for any $\mu>0,(\mu \bar{k}, \hat{M}) \in \mathfrak{C}$, and then, (3.8) leads to

$$
\eta<\left\langle\tilde{y}^{*}, \mu \bar{k}\right\rangle+\hat{M}, \quad \forall \mu>0,
$$

or equivalently,

$$
\left\langle\tilde{y}^{*}, \bar{k}\right\rangle>\frac{\eta-\hat{M}}{\mu}, \quad \forall \mu>0
$$

Letting $\mu \rightarrow+\infty$, one gets $\left\langle\tilde{y}^{*}, \bar{k}\right\rangle \geq 0$, which implies $\tilde{y}^{*} \in Y_{+}^{*}$.

- It is obvious that $(y, \phi(x, y)) \in \operatorname{epi} \phi(x,.) \subset \mathfrak{C}$ for all $(x, y) \in \operatorname{dom} \phi$. So, it follows from (3.8) that $\eta<\tilde{\alpha}<\left\langle\tilde{y}^{*}, y\right\rangle+\phi(x, y)$ for any $(x, y) \in \operatorname{dom} \phi$, and hence,

$$
\begin{aligned}
\eta<\tilde{\alpha} & \leq \inf _{(x, y) \in \operatorname{dom} \phi}\left\{\phi(x, y)+\left\langle\tilde{y}^{*}, y\right\rangle\right\} \\
& =\inf _{(x, y) \in X \times Y}\left\{\phi(x, y)+\left\langle\tilde{y}^{*}, y\right\rangle\right\} \\
& \leq \sup _{y^{*} \in Y_{+}^{*}(x, y) \in X \times Y} \inf \left\{\phi(x, y)+\left\langle y^{*}, y\right\rangle\right\} \\
& =v\left(\mathrm{D}_{+}\right) .
\end{aligned}
$$

This contradicts our assumption $\eta \geq v\left(\mathrm{D}_{+}\right)$. Consequently, we arrive at $\eta \in \mathcal{M}$.

The rest of the proof runs as in Step 3 of the proof of Theorem 3.1, one gets $v\left(\mathrm{D}_{+}\right)=\inf \mathcal{M}$, and $v\left(\mathrm{D}_{+}\right)=\min \mathcal{M}$ if $v\left(\mathrm{D}_{+}\right) \in \mathbb{R}$.

## 4. Characterization of zero duality gap under convex setting

We are in the position to establish the main results of this paper, that is characterizing zero duality gap for general vector optimization problem (P) in convex setting. We assume throughout this section that $\phi$ is a convex function.

Definition 4.1. We say that the problem (P) has zero duality gap if $v(\mathrm{P})=v(\mathrm{D})$ and that $(\mathrm{P})$ has zero loose duality gap if $v(\mathrm{P})=v\left(\mathrm{D}_{+}\right)$.

According to Proposition 3.4, one has $v\left(\mathrm{D}_{+}\right) \leq v(\mathrm{D}) \leq v(\mathrm{P})$. So, if $v(\mathrm{P})=v\left(\mathrm{D}_{+}\right)$then $v(\mathrm{P})=v(\mathrm{D})$, or in the other words, if ( P ) has zero loose duality gap then it has zero duality gap.

It is easy to see that

$$
\overline{\mathfrak{C} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)} \subset \overline{\mathfrak{C}} \cap \overline{\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)}=\overline{\mathfrak{C}} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right), \text { (4.1) }
$$

where the last equality follows from the fact that $0_{Y} \times \mathbb{R}$ is a closed subset of $Y \times \mathbb{R}$. Let us introduce the qualifying condition:

$$
\begin{equation*}
(C Q) \quad \overline{\mathfrak{C} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)}=\overline{\mathfrak{C}} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right), \tag{4.2}
\end{equation*}
$$

which also means that the converse inclusion of (4.1) holds. It is observing that the condition ( $C Q$ ) is a general type of the one introduced recently by Khanh et al. (2019) when they studied zero duality gap for linear programming problems.

Theorem 4.1 (Characterization of zero duality gap). The following statements are equivalent to each other:
(i) (CQ) holds.
(ii) (P) has zero duality gap.

Proof. $[(i) \Rightarrow(i i)]$ Let $\pi_{\mathbb{R}}: Y \times \mathbb{R} \rightarrow \mathbb{R}$ be the conical projection from $Y \times \mathbb{R}$ to $\mathbb{R}$ (i.e., $\pi_{\mathbb{R}}(y, r)=r$ for all $\left.(y, r) \in Y \times \mathbb{R}\right)$. According to Proposition 3.3 and Theorem 3.1, one has

$$
\begin{aligned}
v(\mathrm{P}) & =\inf \overline{\left\{r \in \mathbb{R}:\left(0_{Y}, r\right) \in \mathfrak{C}\right\}} \\
& =\inf \pi_{\mathbb{R}}\left(\overline{\mathfrak{C} \cap\left\{0_{Y}\right\} \times \mathbb{R}}\right)
\end{aligned}
$$

and

$$
\begin{aligned}
v(\mathrm{D}) & =\inf \left\{r \in \mathbb{R}:\left(0_{Y}, r\right) \in \overline{\mathfrak{C}}\right\} \\
& =\inf \pi_{\mathbb{R}}\left(\overline{\mathfrak{C}} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)\right) .
\end{aligned}
$$

So, if $(C Q)$ holds then $v(\mathrm{P})=v(\mathrm{D})$, which is nothing else but (ii).
$[(i i) \Rightarrow(i)]$ Assume that (ii) holds, i.e., $v(\mathrm{P})=v(\mathrm{D})$. The proof is completed by showing that ( $i$ ) holds. According to (4.1), it is sufficient to show that

$$
\begin{equation*}
\overline{\mathfrak{C}} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right) \subset \overline{\mathfrak{C} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)} . \tag{4.3}
\end{equation*}
$$

For this purpose, we take $\left(0_{Y}, \bar{r}\right) \in \overline{\mathfrak{C}} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)$. We now show that $\left(0_{Y}, \bar{r}\right) \in \overline{\mathfrak{C} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)}$. Indeed, as

$$
v(\mathrm{D})=\inf \left\{r \in \mathbb{R}:\left(0_{Y}, r\right) \in \overline{\mathfrak{C}}\right\}
$$

(see Theorem 3.1), one has $\bar{r} \geq v(\mathrm{D})$. Consequently, by assumption that (ii) holds, we obtain:

$$
\begin{equation*}
\bar{r} \geq v(\mathrm{P})=\inf _{x \in X} \phi\left(x, 0_{Y}\right) . \tag{4.4}
\end{equation*}
$$

For each $n \in \mathbb{N}^{*}$, we set $r_{n}:=\bar{r}+\frac{1}{n}$. The last inequality (4.4) implies that $r_{n}>\inf _{x \in X} \phi\left(x, 0_{Y}\right)$ for any $n \in \mathbb{N}^{*}$, which leads to the existence of $x_{n} \in X$ such that $r_{n}>\phi\left(x_{n}, 0_{Y}\right)$ for any $n \in \mathbb{N}^{*}$. Hence, $\left(0_{Y}, r_{n}\right) \in e p i \phi\left(x_{n},.\right) \subset \mathfrak{C}, \quad$ giving rise to $\left(0_{Y}, r_{n}\right) \in \mathfrak{C} \cap\left(0_{Y} \times \mathbb{R}\right)$. This, together with the fact that $\left(0_{Y}, r_{n}\right) \rightarrow\left(0_{Y}, \bar{r}\right)$, yields $\left(0_{Y}, \bar{r}\right) \in \overline{\mathfrak{C} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)}$, which completes the proof.

Example 4.1. Let $X_{+}$be a non-empty convex cone in $X$. We consider the equality constrained linear programming problem of the form:
(EP) $\quad \inf \langle\zeta, x\rangle$

$$
\begin{aligned}
\text { s.t. } A x & =b \\
x & \in X_{+}
\end{aligned}
$$

where $\zeta \in X^{*}, b \in Y$, and $A$ being a continuous linear function from $X$ to $Y$.

Let us introduce the perturbation mapping $\phi: X \times Y \rightarrow \mathbb{R} \cup\{+\infty\}$ such that

$$
\phi(x, y)=\left\{\begin{array}{l}
\langle\zeta, x\rangle \quad \text { if } A x+y=b \text { and } x \in X_{+} \\
+\infty \text { else. }
\end{array}\right.
$$

Then, (EP) can be rewritten as $\inf _{x \in X} \phi\left(x, 0_{Y}\right)$ in the form of $(\mathrm{P})$. The characterizing set $\mathfrak{C}$ now reduces to the set

$$
M=\left\{(b-A x,\langle\zeta, x\rangle+r): x \in X_{+}, r \geq 0\right\}
$$

while the dual problem (D) becomes

$$
\begin{array}{ll}
\text { (ED) } & \sup \left\langle y^{*}, b\right\rangle \\
& \text { s.t. } \zeta-A^{\#} y^{*} \in X_{+}^{*} \\
& y^{*} \in Y^{*} .
\end{array}
$$

In this case, the condition ( $C Q$ ) collapses to $\bar{M} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)=\overline{M \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)}$. According to Theorem 4.1, one has $\inf (E P)=\sup (E D)$ if and only if $\bar{M} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right) \subset \overline{M \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)}$.

Theorem 4.2 (Characterization of zero loose duality gap). Assume that the condition ( $C_{0}$ ) in Theorem 3.2 is fulfilled. Then, the following statements are equivalent to each other:
(i) (CQ) holds.
(ii) (P) has zero loose duality gap.

Proof. Similar to the proof of Theorem 4.1, using Theorem 3.2 instead of Theorem 3.1.

We now consider the new qualifying condition
$(C Q R) \quad \mathfrak{C} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)=\overline{\mathfrak{C}} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)$.
We say that $\mathfrak{C}$ is closed regarding the set $0_{Y} \times \mathbb{R}$ if (CQR) holds. It is worth observing that if (CQR) holds, then (CQR) does, too.

The next corollary is an immediate consequence of the above theorems.

Corollary 4.1 Assume that (CQR) holds. Then, it holds:
(i) (P) has zero duality gap.
(ii) If $\left(C_{0}\right)$ in Theorem 3.2 holds then ( P ) has zero loose duality gap.

Proof. As (CQR) holds, one has

$$
\overline{\mathfrak{C} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)}=\overline{\overline{\mathfrak{C}} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right)}=\overline{\mathfrak{C}} \cap\left(\left\{0_{Y}\right\} \times \mathbb{R}\right),
$$

which means that $(C Q)$ holds. The conclusion now follows from Theorems 4.1 and 4.2.
5. Application: Zero duality gap for composite optimization problems

In this last section, we apply the general results established in the previous sections to derive zero duality gap for the composite optimization problem. We are concerned with the composite optimization problems, of the form (Boţ, 2010, Boţ et al., 2005, Dinh \& Mo, 2012)

$$
\text { (CP) } \quad \inf _{x \in X}[f(x)+(g \circ H)(x)] \text {, }
$$

where $X, Z$ are locally convex Hausdorff topological vector spaces, $Z_{+}$is non-empty convex cone in $\quad Z, f: X \rightarrow \overline{\mathbb{R}}, g: Z \rightarrow \overline{\mathbb{R}}$, and $H: X \rightarrow Z^{\cdot}$ are proper mappings such that $\operatorname{dom} f \cap H^{-1}(\operatorname{dom} g) \neq \varnothing$ and we adopt the convention $g\left(+\infty_{Z}\right)=+\infty$.

In the rest of this section, we will establish various characterizations of zero duality gap for the problem (CP) due to different choices of the perturbation function $\phi$ introduced in Section 1.

### 5.1. The first way of transforming

Consider $Y=Z, Y_{+}=Z_{+}$, and $\phi_{1}: X \times Z \rightarrow \overline{\mathbb{R}}$ defined by

$$
\begin{equation*}
\phi_{1}(x, z)=f(x)+g(H(x)-z) . \tag{5.1}
\end{equation*}
$$

It is easy to see that

$$
\begin{aligned}
\operatorname{dom} \phi_{1}\left(., 0_{z}\right) & =\operatorname{dom}(f+g \circ H) \\
& =\operatorname{dom} f \cap H^{-1}(\operatorname{dom} g),
\end{aligned}
$$

and hence, by above assumption, $\operatorname{dom} \phi_{1}\left(., 0_{z}\right) \neq \varnothing$.
It is worth noting that when taking $\phi=\phi_{1}$, the problem ( P ) collapses to the problem ( CP ). In this case, characterizations of zero duality gap for the problem ( P ) are also the ones for the problem ( CP ).

The next lemma gives us specific forms of the characterization set $\mathfrak{C}$ and dual problems (D) and $\left(\mathrm{D}_{+}\right)$in this setting.

Lemma 5.1. With $Y=Z, Y_{+}=Z_{+}$, and $\phi=\phi_{1}$ given by (5.1), the set $\mathfrak{C}$, the problems (D) and $\left(\mathrm{D}_{+}\right)$become, respectively,

$$
\begin{equation*}
\mathfrak{C}_{1}:=\operatorname{im}(H, f)-\operatorname{hyp}(-g), \tag{5.2}
\end{equation*}
$$

and
$\left(C D^{1}\right) \sup _{z^{*} \in \operatorname{dom} g^{*}}\left\{-g^{*}\left(z^{*}\right)+\inf _{x \in X}\left[f(x)+\left\langle z^{*}, H(x)\right\rangle\right]\right\}$,
$\left(C D_{+}^{1}\right) \sup _{z^{*} \in \operatorname{tom} g^{*} \cap x_{+}^{+}}\left\{-g^{*}\left(z^{*}\right)+\inf _{x \in X}\left[f(x)+\left\langle z^{*}, H(x)\right\rangle\right]\right\}$,
where $\operatorname{im}(H, f)=\{(H(x), f(x)): x \in \operatorname{dom} H \cap \operatorname{dom} f\}$.
Proof. See Appendix A.
We now establish the first characterization of zero duality gap for the problem ( CP ) and the one of zero loose duality gap for the problem (CP).

Corollary 5.1 (Characterization of zero duality gap 1). Assume that $f$ is convex, that $g$ is convex and $Y_{+}$-nondecreasing, and that $H$ is a $Y_{+}$ -convex mapping. Then, the following statements are equivalent:
(i) $\overline{\mathfrak{C}_{1} \cap\left(\left\{0_{Z}\right\} \times \mathbb{R}\right)}=\overline{\mathfrak{C}_{1}} \cap\left(\left\{0_{Z}\right\} \times \mathbb{R}\right)$,
(ii) $v(\mathrm{C} P)=v\left(\mathrm{C}^{1}\right)$.

Proof. The convexity of $\phi_{1}$ implies directly from the above assumption. Then, the conclusion follows from Theorem 4.1 and Lemma 5.1.

Corollary 5.2 (Characterization of zero loose duality gap 1). Assume that the assumption of Corollary 5.1 holds. Assume further that the following condition holds

$$
\begin{aligned}
&\left(C_{1}\right) \quad \exists \hat{x} \in X: g\left(H(\hat{x})-Z_{+}\right) \text {is bounded } \\
& \text { from above. }
\end{aligned}
$$

Then, the following statements are equivalent:
(i) $\overline{\mathfrak{C}_{1} \cap\left(\left\{0_{Z}\right\} \times \mathbb{R}\right)}=\overline{\mathfrak{C}_{1}} \cap\left(\left\{0_{Z}\right\} \times \mathbb{R}\right)$,
(ii) $v(\mathrm{C} P)=v\left(\mathrm{C} D_{+}^{1}\right)$.

Proof. It follows from Theorem 4.2 and Lemma 5.1.

### 5.2. The second way of transforming

We now take $Y=X \times Z, Y_{+}=\left\{0_{X}\right\} \times Z_{+}$, and the perturbation $\phi_{2}: X \times X \times Z \rightarrow \overline{\mathbb{R}}$ defined by

$$
\begin{equation*}
\phi_{2}\left(x, x^{\prime}, z\right)=f\left(x+x^{\prime}\right)+g(H(x)-z) \tag{5.3}
\end{equation*}
$$

It is easy to check that $\operatorname{dom} \phi_{2}\left(., 0_{X}, 0_{z}\right) \neq \varnothing$. It is worth observing that in this case, taking $\phi=\phi_{2}$, the problem (P) collapses to the problem (CP).

The formulas of characterization set $\mathfrak{C}$ and dual problems (D) and ( $\mathrm{D}_{+}$) in this the case are given by the following lemma.

Lemma 5.2. With $Y=X \times Z, Y_{+}=\left\{0_{X}\right\} \times Z_{+}$ and $\phi=\phi_{2}$ given by (5.3), the set $\mathfrak{C}$ becomes

$$
\begin{equation*}
\mathfrak{C}_{2}:=\operatorname{gr}\left(0_{Z}, f\right)-\operatorname{gr}(-H, 0)-\left\{0_{X}\right\} \times \operatorname{hyp}(-g), \tag{5.4}
\end{equation*}
$$

while the problems $(\mathrm{D})$ and $\left(\mathrm{D}_{+}\right)$become, respectively,

$$
\left(\mathrm{CD} D^{2}\right) \sup _{\left(x^{*}, z^{*}\right) \operatorname{dod} f^{*} \times \operatorname{dom} \varepsilon^{*}}\left\{-f^{*}\left(x^{*}\right)-g^{*}\left(z^{*}\right)-\left(z^{*} \circ H\right)^{*}\left(-x^{*}\right)\right\},
$$

$$
\left(\mathrm{C} D_{+}^{2}\right) \sup _{\substack{x^{*} \operatorname{dom} f^{*} \\ z^{*} \operatorname{dom} \xi^{*} \cap x_{+}^{*}}}\left\{-f^{*}\left(x^{*}\right)-g^{*}\left(z^{*}\right)-\left(z^{*} \circ H\right)^{*}\left(-x^{*}\right)\right\} .
$$

Proof. See Appendix B.
By combining Lemma 5.2 to Theorem 4.1 and to Theorem 4.2, respectively, we get directly the consequences as follows:

Corollary 5.3 (Characterization of zero duality gap 2). Assume all the assumption of Corollary 5.1. Then, the following statements are equivalent:
(i) $\overline{\mathfrak{C}_{2} \cap\left(\left\{0_{X}\right\} \times \mathbb{R} \times\left\{0_{Z}\right\}\right)}=\overline{\mathfrak{C}_{2}} \cap\left(\left\{0_{X}\right\} \times \mathbb{R} \times\left\{0_{Z}\right\}\right)$,
(ii) $v(\mathrm{C} P)=v\left(\mathrm{C}^{2}\right)$.

Corollary 5.4 (Characterization of zero loose duality gap 2). Assume all the assumption of Corollary 5.1. Assume further that the condition $\left(C_{1}\right)$ in Corollary 5.2 holds Then, the following statements are equivalent:
(i) $\overline{\mathfrak{C}_{2} \cap\left(\left\{0_{X}\right\} \times \mathbb{R} \times\left\{0_{z}\right\}\right)}=\overline{\mathfrak{C}_{2}} \cap\left(\left\{0_{X}\right\} \times \mathbb{R} \times\left\{0_{Z}\right\}\right)$,
(ii) $v(\mathrm{C} P)=v\left(\mathrm{C}_{+}^{2}\right)$.

## Appendix

## Proof of Lemma 5.1.

(i) Prove that $\mathfrak{C}=\mathfrak{C}_{1}$. Take $(z, r) \in \mathfrak{C}$. Then, there exists $x \in X$ such that $(z, r) \in \operatorname{epi} \phi_{1}(x,$.$) ,$ which means $r \geq \phi_{1}(x, z)=f(x)+g(H(x)-z)$, or equivalently, $\quad f(x)-r \leq-g(H(x)-z)$. So, $(H(x)-z, f(x)-r) \in \operatorname{hyp}(-g)$, and hence,

$$
\begin{aligned}
(z, r) & =(H(x), f(x))-(H(x)-z, f(x)-r) \\
& \in(H(x), f(x))-\operatorname{hyp}(-g) .
\end{aligned}
$$

Moreover, the inequality $r \geq f(x)+g(H(x)-z)$ also leads to $x \in \operatorname{dom} f \cap \operatorname{dom} H=\operatorname{dom}(H, f)$. So, one gets $(z, r) \in \operatorname{im}(H, f)-\operatorname{hyp}(-g)$.

Take $\quad(z, r) \in \mathfrak{C}_{1}$. Then, there are $x \in \operatorname{dom}(H, f)=\operatorname{dom} f \cap \operatorname{dom} H$ and $(u, \alpha) \in \operatorname{hyp}(-g)$ such that $(z, r)=(H(x), f(x))-(u, \alpha)$, which means

$$
\begin{equation*}
z=H(x)-u \quad \text { and } \quad r=f(x)-\alpha . \tag{5.5}
\end{equation*}
$$

As $(u, \alpha) \in \operatorname{hyp}(-g)$, one has $\alpha \leq-g(u)$, or equivalently, $-\alpha \geq g(u)$, and hence, by (5.5), $r \geq f(x)+g(u)=f(x)+g(H(x)-z)=\phi_{1}(x, z)$.
This yields $(z, r) \in \operatorname{epi} \phi_{1}(x,.) \subset \mathfrak{C}_{1}$ and we are done.
(ii) Prove that $\sup (\mathrm{D})=\sup \left(\mathrm{C} D^{1}\right)$. By the definition of the Lagrange dual problem (D) (see Subsection 3.2), one has $\sup (\mathrm{D})=\sup _{z^{*} \in z^{*}} D_{z^{*}}$ where

$$
D_{z^{*}}:=\inf _{(x, z) \in X \times Z}\left[\phi_{1}(x, z)+\left\langle z^{*}, z\right\rangle\right]
$$

(recall that, at this time, $Y=Z$ and $\phi=\phi_{1}$ ).
For each $z^{*} \in Z^{*}$, according to (5.1), we have

$$
\begin{aligned}
D_{z^{*}} & =\inf _{(x, z) \in X \times Z}\left[f(x)+g(H(x)-z)+\left\langle z^{*}, z\right\rangle\right] \\
& =\inf _{(x, u) \in X \times Z}\left[f(x)+g(u)+\left\langle z^{*}, H(x)-u\right\rangle\right] \\
& =-\sup _{u \in Z}\left[\left\langle z^{*}, u\right\rangle-g(u)\right]+\inf _{x \in X}\left[f(x)+\left\langle z^{*}, H(x)\right\rangle\right] \\
& =-g^{*}\left(z^{*}\right)+\inf _{x \in X}\left[f(x)+\left\langle z^{*}, H(x)\right\rangle\right] .
\end{aligned}
$$

So, we get

$$
\begin{aligned}
\sup (\mathrm{D}) & =\sup _{z^{*} \in Z^{*}}\left\{-g^{*}\left(z^{*}\right)+\inf _{x \in X}\left[f(x)+\left\langle z^{*}, H(x)\right\rangle\right]\right\} \\
& =\sup _{z^{*} \in \operatorname{dom} g^{*}}\left\{-g^{*}\left(z^{*}\right)+\inf _{x \in X}\left[f(x)+\left\langle z^{*}, H(x)\right\rangle\right]\right\} \\
& =\sup \left(\mathrm{C} D^{1}\right)
\end{aligned}
$$

where the third equality follows from the fact that $g^{*}\left(u^{*}\right)=+\infty$ whenever $u^{*} \notin \operatorname{dom} g^{*}$.
(iii) Similar arguments apply to the problem $\left(\mathrm{D}_{+}\right)$to obtain $\sup \left(\mathrm{D}_{+}\right)=\sup \left(\mathrm{C} D_{+}^{1}\right)$, and the proof is complete.

## Proof of Lemma 5.2.

Prove that $\mathfrak{C}=\mathfrak{C}_{2}$. Take $\left(x^{\prime}, z, r\right) \in \mathfrak{C}$. Then, there is $x \in X$ such that $\left(x, x^{\prime}, z, r\right) \in \operatorname{epi} \phi_{2}(x, \ldots$,$) ,$ i.e.,

$$
\begin{equation*}
r \geq \phi_{2}\left(x, x^{\prime}, z\right)=f\left(x+x^{\prime}\right)+g(H(x)-z) . \tag{5.6}
\end{equation*}
$$

On the other hand, we can rewrite $\left(x^{\prime}, z, r\right)$ as

$$
\begin{align*}
\left(x^{\prime}, z, r\right)= & \left(x+x^{\prime}, 0_{z}, f\left(x+x^{\prime}\right)\right)-(x,-H(x), 0) \\
& -\left(0_{x}, H(x)-z, f\left(x+x^{\prime}\right)-r\right) . \tag{5.7}
\end{align*}
$$

It follows from (5.6) that

$$
\begin{gathered}
x+x^{\prime} \in \operatorname{dom} f=\operatorname{dom}\left(0_{z}, f\right), \\
x \in \operatorname{dom} H=\operatorname{dom}(-H, 0),
\end{gathered}
$$

and

$$
f\left(x+x^{\prime}\right)-z \leq-g(H(x)-z) .
$$

This, together with (5.6), yields
$\left(x^{\prime}, z, r\right) \in \operatorname{gr}\left(0_{z}, f\right)-\operatorname{gr}(-H, 0)-\left\{0_{X}\right\} \times \operatorname{hyp}(-g)$.
Conversely, take $\left(x^{\prime}, z, r\right) \in \mathfrak{C}_{2}$. Then, there are $u \in \operatorname{dom}\left(0_{z}, f\right)=\operatorname{dom} f, v \in \operatorname{dom}(-H, 0)=\operatorname{dom} H$, and

$$
(w, \alpha) \in \operatorname{hyp}(-g)
$$

such that
$\left(x^{\prime}, z, r\right)=\left(u, 0_{z}, f(u)\right)-(v,-H(v), 0)-\left(0_{x}, w, \alpha\right)$,
and hence
$x^{\prime}=u-v, \quad z=H(v)-w \quad$ and $\quad r=f(u)-\alpha$.
As $(w, \alpha) \in \operatorname{hyp}(-g)$, we have $\alpha \leq-g(u)$.
Combining this with (5.8) $-\alpha \geq g(u)$, we get

$$
\begin{aligned}
r \geq f(u)+g(w) & =f\left(v+x^{\prime}\right)+g(H(v)-z) \\
& =\phi_{2}\left(u, x^{\prime}, z\right) .
\end{aligned}
$$

Consequently, $\left(x^{\prime}, z, r\right) \in \operatorname{epi} \phi_{2}(u,.) \subset \mathfrak{C}_{2}$ and we are done.

The proof of equalities $\sup (\mathrm{D})=\sup \left(C D^{2}\right)$ and $\sup (\mathrm{D})=\sup \left(\mathrm{C} D_{+}^{2}\right)$ is similar as in that of Lemma 5.1.
